## *Curriculum Vitae*

### Summary

Communicating science is just as important as doing science. Without being able to explain your motivation and results, finding support (either funding or otherwise) will be difficult. Aside from getting direct support, explaining and exploring the social consequences of science and technology is vital. Science and technology can change the world, but history shows that those changes don't come without tradeoffs. Thinking hard about these areas requires engaging with a variety of different people on complex subjects.

Research-wise, my PhD has been focused on developing and applying computational methods to study materials used in LEDs. LED bulbs are still very expensive compared to bulbs like incandescents and compact-fluorescents. I am trying to reduce that cost by modeling LED materials on supercomputers. My methods can predict properties of materials long before an experimentalists has to go through the expensive and time consuming process of making the material in the lab. That time and money can be saved by my calculations, leading to faster discovery of materials that have desirable properties. With my calculations, I hope to find new materials that can be realized in the lab that will lead to more efficient and cheaper LEDs.
